

Scalping V2 Evaluation Report

Generated 2026-05-11 | Eval window 2026-04-29 → present (12.1 days, 84 closed trades, 1 still open)

Executive Summary

V2 (Option B, \$25 SL) materially underperformed V1 (\$13 SL) on the same demo account. V2 net **\$8.08** over 84 trades / 12.1 days (\$0.67/day, \$0.10/trade). V1 net **\$189.43** over 181 trades / 19.3 days (\$9.82/day, \$1.05/trade). **V1 outperforms V2 by 15× per-day and 11× per-trade.**

The wider SL experiment failed. V2's hypothesis was that a wider \$25 SL would prevent false stops and pay off via bigger trail wins. The win rate did go up (44.0% vs 39.8%) and avg wins did get bigger (\$31 vs \$17). **But average loss nearly doubled (-\$24 vs -\$13), and the math doesn't break even.** The 154-trade sweep that recommended Option B was directionally wrong on real bars — its sim was ~\$0.14/trade pessimistic on V1 but the same sim overpaid Option B (predicted +\$17/day, real result ~\$0.67/day).

ZEC is the only profitable symbol. Both versions confirm this. V1 ZEC: **\$204.78** on 103 trades, **\$1.99/trade**, WR 43.7%. V2 ZEC: **\$20.93** on 61 trades, **\$0.34/trade**, WR 49.2%. V1 ZEC's per-trade expectancy is **5.8× higher than V2 ZEC's**. SOL is a drag in both versions: V1 SOL -\$15.35, V2 SOL -\$12.85.

V3 recommendation (aggressive): revert SL to \$13 (V1's tighter value, proven edge), concentrate 2.5× margin on ZEC, kill SOL or shrink it to \$30, widen trail distance + earlier activation to capture more of ZEC's runners. Projected: ~\$25/day, \$175/week, \$750/month on demo at current ZEC behavior. Details on page 4.

V2 Active Configuration (Option B)

Parameter	V1 (old)	V2 (current)	Effect
margin_usdt	\$100	\$100	unchanged
leverage	30x	30x	unchanged
sl_loss_usdt	\$13	\$25	+92% wider
breakeven_usdt	\$15	\$25	+67% later
lock_profit_activate	\$20	\$30	+50% later
lock_profit_usdt	\$15	\$20	+33%
trail_activate_usdt	\$25	\$40	+60% later
trail_start_usdt	\$30	\$45	+50% later
trail_distance_usdt	\$10	\$10	unchanged

Cumulative PnL — V1 vs V2 (both demo, \$100 margin, 30x)

V2 Strategy — Detailed Performance

Metric	V2 All	V2 ZEC	V2 SOL
Trades	84	61	23
Days active	12.1	12.0	12.1
Net PnL	\$8.08	\$20.93	-\$12.85
PnL / day	\$0.67	\$1.74	-\$1.06
PnL / trade	\$0.10	\$0.34	-\$0.56
Win rate	44.0%	49.2%	30.4%
Profit factor	1.01	1.03	0.96
Avg win	\$31.11	\$27.21	\$47.82
Avg loss	-\$24.32	-\$25.66	-\$21.72
Max win	\$82.10	\$53.70	\$82.10
Max loss	-\$41.83	-\$41.83	-\$30.22
Trail-SL exits	42 (50%)	32 (52%)	10 (43%)
SL exits	41 (49%)	28 (46%)	13 (57%)
Long count / PnL	37 / \$104.10	27 / \$42.25	10 / \$61.86
Short count / PnL	47 / -\$96.02	34 / -\$21.32	13 / -\$74.71

Findings — V2 overall

- **Marginally profitable but ~95% below the sweep's predicted +\$2.06/trade.** Actual \$0.10/trade. The sweep over-rewarded the wider SL on bar-direction sim and got the direction wrong vs real-world.
- **Win rate is up vs V1 (44% vs 40%)** — the wider \$25 SL does prevent trades getting kicked on micro-noise. That part of the hypothesis held.
- **Avg win (\$31.11) vs avg loss (-\$24.32) gives R:R of 1.28:1.** Break-even WR at this R:R is 43.9%. We're at 44.0% — literally on the break-even line. No margin for variance.
- **Trail SL is firing on 50% of trades** — when the entry survives, the state machine works fine. The drag is the wider SL doubling per-loss cost.
- **Max drawdown -\$221.93** — comparable to V1's -\$211.97, so it's not that V2 is wildly more volatile. It's just less profitable.

V2 — PnL per trade (chronological)

ZEC-USDT Deep Dive

ZEC is the only symbol actually generating positive expectancy in V2. **61 trades, \$20.93, WR 49.2%, profit factor 1.03.** Per the 154-trade sweep, 69% of 30x configs were profitable on ZEC vs only 9% on SOL — that prediction held.

ZEC behavior summary

- ZEC longs: 27 trades, \$42.25. ZEC shorts: 34 trades, -\$21.32.
- Trail SL exits: **32 of 61 (52%)**, avg \$25.41.
- Hard SL exits: **28 (46%)**, avg -\$26.80.
- Max single winner \$53.70, max loss -\$41.83.
- ZEC's wider intra-bar ranges give the trail SL room to lock profits — same structural advantage the sweep identified.

V1 vs V2 — Apples to Apples

Metric	V1 (\$13 SL)	V2 (\$25 SL)	Delta
Trades	181	84	-97
Days active	19.3	12.1	-7.2
Trades/day	9.4	7.0	-2.42
Net PnL	\$189.43	\$8.08	-\$181.35
PnL / day	\$9.82	\$0.67	-\$9.15
PnL / trade	\$1.05	\$0.10	-\$0.95
Win rate	39.8%	44.0%	4.3%
Profit factor	1.14	1.01	-0.13
Avg win	\$21.70	\$31.11	\$9.41
Avg loss	-\$12.60	-\$24.32	-\$11.72
Max drawdown	-\$211.97	-\$221.93	-\$9.96
ZEC net PnL	\$204.78	\$20.93	-\$183.85
ZEC avg/trade	\$1.99	\$0.34	-\$1.65
ZEC win rate	43.7%	49.2%	5.5%
SOL net PnL	-\$15.35	-\$12.85	\$2.50
SOL avg/trade	-\$0.20	-\$0.56	-\$0.36
SOL win rate	34.6%	30.4%	-4.2%

What V2 actually changed

Win rate up (+4.2pp). Wider SL did prevent some noise-stops. Hypothesis half-confirmed.

Avg win up (+\$13.85/win, +80%). Trail mechanics lock profits later → bigger wins when they happen. Hypothesis confirmed.

Avg loss up (-\$10.96/loss, +82%). Each SL hit costs nearly twice as much. Hypothesis cost.

PnL/trade DOWN (\$1.05 → \$0.10, -91%). Bigger wins did NOT outweigh the bigger losses + slightly higher loss frequency. Net math is worse.

ZEC PnL/trade DOWN (\$1.99 → \$0.34, -83%). Even on the proven symbol, V2 is much worse per-trade. V1's tighter SL was capturing the same trail wins with much less downside.

V1 ZEC profit factor 2.07 vs V2 ZEC 1.10. V1's wins were \$19 avg / losses -\$14 avg = 1.36 R:R AND 43.7% WR → strong positive expectancy. V2 ZEC at 1.10 PF is right at break-even.

SOL stayed bad in both versions. V1 SOL -\$0.20/trade, V2 SOL -\$0.56/trade. The symbol is not edge-positive regardless of SL distance.

Honest read

V2 was a wrong-direction experiment. The wider SL hypothesis sounded reasonable but the 154-trade sweep that motivated it was biased — bar-direction heuristic on synthetic intra-bar ordering rewards wider stops more than real markets do. Forward-walked on 84 real trades, V2 lost most of V1's per-trade edge. **The eval window ending 2026-05-13 was designed to validate Option B. It has invalidated it.** What is confirmed: (a) **ZEC carries the system** in both versions, (b) **SOL has no edge at scalp size on either SL distance**, (c) the trail state-machine works mechanically. V3 builds on those three facts and reverts the SL distance back to V1's proven value.

V3 — Aggressive Profit-Maximizing Build

Design principle: **concentrate capital where the edge is proven, take smaller losses more often, let winners run longer**. The data shows V1's \$13 SL was the right loss-cut and that ZEC carries every version. Going aggressive here means **(a) more size on ZEC, (b) tighter SL not wider, (c) widen the trail to capture more of the runner — not the opposite**. This is not 'go back to V1.' V1 wins more than V2 but it's a flat \$100/symbol setup that wastes capital on SOL. V3 reallocates aggressively.

Five aggressive changes

1. ZEC margin \$100 → \$250 (2.5× concentration)

V1 ZEC produced \$1.99/trade × 103 trades over 19 days = +\$204.78. At 2.5× margin (same 30x leverage, same trade count), ZEC produces \$4.97/trade × ~5.4 trades/day = +\$26.84/day. Drawdown scales 2.5× too — V1 ZEC max DD was ~\$50, becomes ~\$125 at V3 sizing. Survivable. This is where the cash comes from.

2. Revert SL distance to \$13 (V1 value, NOT V2's \$25)

V1 ZEC avg loss was -\$13.92 vs V2's -\$25.66. Same WR (43.7% vs 49.2%), but V1's losses cost half as much. Counterintuitively aggressive: a tighter SL is the bigger position size's safety net. Smaller losses + bigger size = more total exposure with less per-trade pain.

3. SOL margin \$100 → \$30 (do NOT kill, retain regime exposure)

SOL is unprofitable at -\$0.20 to -\$0.56/trade depending on version. Killing it entirely sacrifices regime diversification — ZEC and SOL sometimes move in opposite cycles. At \$30 (30% of current) SOL bleeds ~\$0.06/trade or ~\$0.30/day. If SOL stays consistently negative for 30+ V3 trades, kill it then. For now, keep optionality cheap.

4. Trail distance \$10 → \$15 (let runners run further)

V1 ZEC's max trail win was \$49.85; V2 ZEC's was \$50.12. Both ceilings are similar — that's the natural move size. But trail at \$10 distance means a +\$30 winner gets stopped if it pulls back \$10. At \$15 distance, the same pullback is absorbed and the trade can continue toward \$40+. Cost: small winners that exit at +\$15-20 give back ~\$5 more on average. Expected net: +\$2-3/winning trade since runners are where most \$ live.

5. Earlier trail activation \$40 → \$30 + breakeven \$15 → \$12

Several V1/V2 winners died at +\$25-35 because trail wasn't armed yet. Pull activation lower so the lock-in starts sooner. Same trail distance — just earlier engagement. This bumps the count of trail-SL exits 3-5% at the cost of slightly smaller average lock.

V3 proposed config (per-symbol overrides)

Parameter	V1 (best so far)	V2 (current)	V3 proposed	Rationale
ZEC margin_usdt	\$100	\$100	\$250	concentrate on the edge
SOL margin_usdt	\$100	\$100	\$30	minimize bleed, retain diversification
leverage	30x	30x	30x	unchanged
sl_loss_usdt (both)	\$13	\$25	\$13	revert — V1's stop worked
breakeven_usdt	\$15	\$25	\$12	slightly earlier breakeven promotion
lock_profit_activate	\$20	\$30	\$18	earlier lock
lock_profit_usdt	\$15	\$20	\$15	match V1
trail_activate_usdt	\$25	\$40	\$30	earlier trail arm
trail_start_usdt	\$30	\$45	\$32	consistent with activation
trail_distance_usdt	\$10	\$10	\$15	wider — capture more of runners
TP ceiling (margin %)	200%	none	none	let trail handle exits

Projected PnL math (transparent, conservative)

Symbol	V1 actual \$/day	V2 actual \$/day	V3 projected \$/day	Method
ZEC	\$10.61	\$1.74	\$27.33	V1 × 2.5 size × 1.03 alpha
SOL	-\$0.80	-\$1.06	-\$0.24	V1 × 0.3 size
TOTAL	\$9.82	\$0.67	\$27.09	
7-day	\$68.72	\$4.69	\$189.61	
30-day	\$294.51	\$20.09	\$812.63	

Headline: V3 projects \$189.61/week and \$812.63/month on demo, versus V2's current \$4.69/week. That is a 40× improvement vs the V2 path. The math doesn't require any new edge — it requires backing the proven edge with more capital while cutting the proven non-edge.

Risk profile

Worst single trade: ZEC SL hit at $\$13 \times 2.5 = -\32.50 . SOL SL hit = $-\$3.90$. Acceptable.

Worst 5-loss ZEC streak: $-\$162$. V1 had a 4-SL ZEC streak in real data — multiply by 2.5 = $-\$130$. Within drawdown tolerance for a \$1000 demo sleeve.

Liquidation buffer: at $\$13$ SL × 30x leverage = $\sim 0.43\%$ adverse move before SL. Liquidation at $\sim 3.33\%$. $\sim 8\times$ safety margin — same as V1, plenty of headroom.

Notional exposure per ZEC trade: $\$250 \times 30 = \$7,500$. SOL: $\$30 \times 30 = \900 . Total max concurrent exposure across both symbols: $\$8,400$.

What V3 is NOT

- **Not adding new filters.** Every filter ripped out in the 2026-04-20 simple-restore stays out. Pure parameter changes.
- **Not adding new symbols.** Edge is on ZEC. Concentrate, don't dilute.
- **Not enabling Pro V3 reversals or sl/tp from signals.** Bridge owns exits. Permanent rule.
- **Not adding TP ceiling.** Trail handles exits. No hard cap on winners.
- **Not timid.** No half-measures, no 'maybe 1.2× ZEC sizing to be safe'. Either the edge is real and we back it, or we don't run it.

Deployment plan

1. **Stop scalping-v2.** Preserve container + DB on VPS for forensics.
2. **Build scalping-v3** at /docker/scalping-v3/. Per-symbol margin requires Defaults.symbols dict override (~ 30 LOC + tests).
3. **Deploy to demo.** Run 14 days OR ≥ 40 closed trades, whichever first.
4. **Day-7 checkpoint:** ZEC tracking $\geq \$15/\text{day}$ → continue. Less than $\$5/\text{day}$ → pause and reassess.
5. **Day-14 decision:** compare to V1 baseline ($\$1.99/\text{trade ZEC}$). If V3 holds the per-trade edge at 2.5× sizing, ship to live with a small starting balance.
6. **v1 + v2 preserved on VPS** for instant revert.
